CyberLock Increases Versatility of CyberAudit-Web Software with the Release of CAW Connect App

Corvallis, Oregon – January 2020

In 2018 CyberLock released its most innovative software to date with CyberAudit-Web (CAW) 9.0. The innovation didn't end with the launch of 9.0. CyberLock has continued adding to this release by adding a variety of software capabilities, many of which were spurred by customer requests. CyberLock is continually developing both hardware and software to enhance the customer experience.

CyberLock's latest software innovation is CyberAudit-Web Connect, an app for iOS and Android that adds mobile convenience to monitoring a CyberAudit-Web system and granting special access to CyberLocks and doors. Using the login and password to their CAW system, an administrator may use CAW Connect to grant their current key holders temporary access to CyberLocks when needed. On systems with doors wired to Flex System hubs, the administrator may issue a request to open on a door, cancel or resume a hold-open schedule, or trigger a lockdown via an inter-hub signal. Also available in the CAW Connect App are audit trail records for individual people, CyberLocks, and doors visible to that administrator.
