CyberLock®

Corvallis, Oregon (February, 2022) – CyberLock, Inc., a global leader in key-centric access control solutions, announces the release of CyberAudit-Web 9.5!

CyberAudit-Web (CAW), the software suite for managing CyberLock systems, provides an intuitive interface to assign keys, set expirations, monitor personnel, configure access schedules and more. The latest release, CAW 9.5, introduces Cyber Access, a mobile app that enables Bluetooth access to doors using the Flash RFID reader and the new Flash Keypad RFID reader. The Cyber Access app notifies the user when a door comes in range. The user may tap the notification to open the door. Or Cyber Access can automatically open the door if the hands-free option is enabled.

CyberAudit-Web 9.5 offers many new features such as a Notebook to help keep notes about people, keys, locks, doors, and communicators. Other features include a new method to run reports that can be generated to detail the properties of locks, keys, doors, notebook entries, and other items within a CyberAudit-Web system.

Another valuable new feature of CAW 9.5 introduces integration with Google Maps. With Google Maps, users can visualize where their locks are located and easily assign geo-coordinates for new locks with a simple point and click.
